**SUMMARY.** Postoperative pain is a major problem in clinical practice. Non-steroidal anti-inflammatory drugs have traditionally been used to relieve postoperative pain. Administration of intravenous products together can result incompatibility problems and this is clinically hazardous. Reference texts, published reports can provide information about drugs' incompatibility characteristics but there have been limited data for new drugs such as lornoxicam, tenoxicam and dexketoprofen, commonly used non-steroidal anti-inflammatory drugs. In this study, it was aimed to investigate whether there is precipitation between lornoxicam, tenoxicam and dexketoprofen with other commonly used drugs in anesthesiology practice.

**RESUMEN.** El dolor postoperatorio es un problema importante en la práctica clínica. Los anti-inflamatorios no esteroides se han utilizado tradicionalmente para aliviar el dolor postoperatorio. La administración de productos intravenosos juntos pueden generar problemas de incompatibilidad y esto es clínicamente peligroso. Los textos de referencia y los informes publicados pueden proporcionar información sobre las características de incompatibilidad de drogas, pero ha habido pocos datos para fármacos como el lornoxicam, tenoxicam y dexketoprofeno, medicamentos anti-inflamatorios no esteroides utilizados habitualmente. En este estudio, se propone investigar si hay precipitación entre lornoxicam, tenoxicam y dexketoprofeno con otros fármacos de uso común en la práctica de anestesiología.

---

**KEY WORDS:** Drug compatibility, NSAIDs, Precipitation.
