SUMMARY. Two new ternary Co(II)-based coordination polymers (CPs) with the chemical formulae of $[Co(5\text{-NIP})(L)(H_2O)]_n$ (**1**) and $[Co(1,4\text{-PDA})(L)(H_2O)]_n$ (**2**) ($L = 1,3\text{-bis}(5\text{-methylbenzimidazol-1-yl})\text{propane}$, $5\text{-H}_2\text{NIP} = 5\text{-nitroisophthalic acid}$, $1,4\text{-H}_2\text{PDA} = 1,4\text{-phenylenediacetic acid}$) were hydrothermally synthesized by reaction of Co(II) salt with the L ligand in the presence of different carboxylic acid ligands and structurally characterized via the single crystal X-ray diffraction, elemental analysis and the FT-IR. Its synergistically effect with *Hedyotis diffusa* against lung cancer was explored. Firstly, the migration and invasion of the lung cancer cells after compound treatment was determined with trans-well assay. In addition to this, the relative expression of the EMT gene was measured with real time RT-PCR assay.

RESUMEN. Dos nuevos polímeros de coordinación (CP) basados en Co(II) ternarios con las fórmulas químicas de $[Co(5\text{-NIP})(L)(H_2O)]_n$ (**1**) y $[Co(1,4\text{-PDA})(L)(H_2O)]_n$ (**2**) ($L = 1,3\text{-bis}(5\text{-metilbencimidazol-1-il})\text{propano}$, $5\text{-H}_2\text{NIP} = \text{ácido } 5\text{-nitroisofálico}$, $1,4\text{-H}_2\text{PDA} = \text{ácido } 1,4\text{-fenilendiacético}$) fueron sintetizados hidrotérmicamente mediante la reacción de la sal de Co(II) con el ligando L en presencia de diferentes ligandos de ácido carboxílico y caracterizado estructuralmente mediante difracción de rayos X de monocristal, análisis elemental y FT-IR. Se exploró su efecto sinergético con *Hedyotis diffusa* contra el cáncer de pulmón. En primer lugar, se determinó la migración y la invasión de las células de cáncer de pulmón después del tratamiento con el compuesto con un ensayo trans-well. Además de esto, la expresión relativa del gen EMT se midió con un ensayo de RT-PCR en tiempo real.

KEY WORDS: coordination polymer, *Hedyotis diffusa*, lung cancer
